

Case file:

Tail gates for sows with piglets

Country: Denmark

Grade: Rilsan T blue 7414 MAC

Main reasons for choosing Rilsan:

- Abrasion resistance
- Smooth surface
- Corrosion resistance
- Chemical resistance (urine, cleaning and disinfection agents)

Normally galvanized steel or non coated steel is used for the metal frame surrounding the sow, but a high degree of abrasion from the sow's behind damages the metal frames and results in sharp edges on the frame that cuts the sows and gives infections.

The Rilsan fine powder coating protects the metal frame against the abrasion and the sows is protected from cutting themselves and giving them infections with high costs for treatment afterwards.
